

Climate change threatens us all.
Together we can make a difference...

Come and find out how at
**Mosman Art Gallery & Community Centre on
Thursday, October 25 at 7.00 pm**

If we work together as a community we can achieve so much more than individual action, as the Bega community has shown through the establishment of Clean Energy for Eternity. Be inspired as doctors, business leaders, school students, householders and renewable energy experts from both Bega and Mosman take you through the practical details, and propose a way forward. Let's make Mosman the first city community to seriously address the climate change threat.

Hosted by Mosman Council and chaired by Mayor Denise Wilton

ECO IMPACT

RECYCLING has been stepped up due to the subject of raising waste tax and greenhouse gas emissions - and Italy's quest for clean water is the most obvious.

New data shows the electricity and water used to produce everything people buy - from food and clothing to CDs and electrical appliances - for the first time.

APEC CLIMATE PLAN
A confidential declaration
by the 16 APEC
member states

A confidential document drafted for Sydney's APEC summit reveals Asia Pacific leaders will be asked to back a watershed plan for "aspirational" greenhouse gas goals rather than hard targets. It closely follows

North Sydney, Warrington, Ipswich and Macclesfield follow the C&D to the biggest employers: Cammell-Parker (1997), Pirelli (Huddersfield) and Balfour Beatty (low Backwood) to the biggest.

Over consumption in Britain is eating the Earth. More water used to produce a single beef pound than the average British beef. One average British child uses during an entire year of domestic. Every 1000 new clothing produces 10 kilograms

Over 100 million people are using the Earth. More people used to produce a single T-shirt than the average T-shirt buyer uses during an entire year of ownership. Every \$100 spent on clothing generates 70 Kilopounds

to

1979

C'mon Mosman....

If we can't afford to switch
to green technology, who can?

There is so much that we could do, but most of us are confused. The meeting will help answer your questions.

- Is your roof suitable for solar panels? If so how much power could you generate back into the mains? What would you be paid per kWh?
- How quickly is the price of solar panels likely to fall and how sharply is the cost of electricity likely to rise?
- Could you retro-fit a solar powered booster to your existing hot water system?
- Should your next car be a hybrid car?
- What does green power cost and how easy is it to get?
- Which single change could you make that would have the biggest impact on greenhouse gas emissions and the least impact on your lifestyle?
- What can you do if you are on a strata title?
- How efficient are your appliances compared with the most efficient on the market?
- Which is the biggest source of energy consumption in your house?
- Are there natural ways of reducing your heating and cooling energy demands?

No one can do everything but everyone can do something!

Please come along and tell your friends.

Clean Energy for Eternity (CEFE) is a climate change group that started in the Bega Valley on the far south coast of New South Wales. The group arose after Dr Matthew Nott, a Bega orthopaedic surgeon, invited the local community to join him in making a human sculpture to raise awareness about climate change. On 21 May 2006, over 3,000 people (representing 10% of the population) wrote the words 'Clean Energy for Eternity' along Tathra Beach.

Subsequently a community meeting chaired by the local mayor committed to a target of a 50% reduction in community energy consumption and 50% renewable share of energy production by 2020. Six months later the Bega community had a widely endorsed action plan for achieving its target.

CEFE has since expanded to assist local communities in the Eurobodalla, Cooma Monaro, Snowy River and Shoalhaven shires.

Mosman is the first city based CEFE chapter and represents a shared commitment between the city and the bush to tackle climate change.

On December 2 CEFE is organising its biggest ever human climate change sign on Manly beach as part of the centenary celebrations for Surf Life Saving in Australia.

Matthew Nott is a recipient of the NSW Government's Green Globe Energy Champion in 2006 and in 2007 CEFE was runner up for a Eureka prize.

The Women for Change Alliance has been operating in Mosman since 2006 and has over 100 members it holds functions and stalls to raise individual awareness of steps they can take to reduce CO2 emissions, with particular emphasis on Green Power.

Both groups are not-for-profit and staffed entirely by volunteers. They have dedicated themselves to showing people the way forward in dealing with the climate change issue. The solution lies in individual action, local community initiatives and getting policy changes and a suitable incentive framework introduced at the state and national political level.

In Mosman the groups welcome the initiatives already taken by Mosman Council and look forward to working together with Council through its Sustainability Panel.
